## FIBERBOND® Fittings Guide - Series 20HV, 20HV-C and 20HV(FDA)

### PIPE SERIES:

The fittings contained in this book are available in the following series (unless otherwise noted):

20HV	13.8bar, 200psig (up to 12", 10.3bar up to 24", 6.9bar up to 36", and 3.4bar up to 60") and 65c, 150F rated product for seawater, and cooling water systems, open drains, deck drains, and "column" piping applications.
20HV-C	Identical to 20HV, except it has an electrically conductive exterior for use where grounding is required.
20HV(FDA)	Identical to 20HV, except it uses materials that comply with 21CFR 177.2420 for food contact.
20HV(FDA)-C	Identical to 20HV(FDA), except it has an electrically conductive exterior for use where grounding is required.

### GASKETS:

1. In systems hydrotesting above 225psig (15.5bar), gaskets with better sealing properties, such as Garlock's "Stress Saver" gasket ([www.garlock.com](http://www.garlock.com)), CTG's "ET Energizer" gasket ([www.ctgasket.com](http://www.ctgasket.com)) or Asahi's "Low Torque" gasket ([www.asahi-america.com](http://www.asahi-america.com)), are recommended for sizes 2" (50NB) and larger.
2. O-ring gaskets may also be used, but they do require a special o-ring groove to be machined in one face (and only one face) of the mating pair of flanges. O-ring gaskets have no takeout. Shore "A" hardness values are typically between 55 and 75. A typical material is Buna-N (NBR). For higher temperatures and resistance to certain acids and solvents, Viton® is also available. Viton® is a fluoroelastomer manufactured by DuPont Dow.
3. In systems hydrotesting between 150psig (10.3bar) and 225psig (15.5bar), either full-face 1/8" thick flat rubber gaskets (neoprene, red rubber, etc.) or gaskets with better sealing properties may be used in sizes 2" (50NB) and larger.
4. In systems hydrotesting only up to 150psig (10.3bar), full-face 1/8" thick rubber gaskets are recommended. Shore "A" hardness values can range from 60 to 80, although values down to 50 may be suitable as well as higher values.
5. These gasket recommendations do not take into account the required corrosion resistance of the systems. Make sure that gasket materials are suitable for the intended services. CR (neoprene) is normally good for water and seawater and has excellent weathering resistance. SBR (red rubber) is normally good for water, seawater, alcohol, glycol, and weak acids. NBR (Buna-N) is normally good for water, seawater, dilute acids, and aliphatic hydrocarbons (propane, butane, petroleum oil, mineral oil, grease, diesel fuel). EPDM (ethylene-propylene-diene rubber) is a good choice for hot water service, many solvents and many acid services.

---

## **RULES FOR O-RING GASKETS:**

1. Takeout of the gasket is essentially zero inches. The gasket is 3/16" (0.1875", 4.8mm) nominal diameter and the groove is 0.15" (3.8mm). With compression of the gasket, the takeout is zero.

2. A groove is only provided in one face of each mating pair of flanges. The #1 situation to avoid with the o-ring gasket is a grooved flange mated directly to another grooved flange. The only solution to this situation is 1) remove one of the grooved flanges and replace with a flat-face flange, 2) fill one of the grooved flanges with a putty material to obtain a flat-face, or 3) insert a rubber gasket or harder material between the two grooved flanges along with an o-ring gasket in each groove to provide a suitable seal.

3. Other general rules that are usually followed with o-ring gaskets:

A. For FRP to FRP flange connection, the groove is placed in one of the FIBERBOND® flanges at the discretion of the fabricator. For convenience during installation, if the flange is in the vertical, the groove is normally placed in the lower flange.

B. For connections to alloy flanges, the groove is applied to the FIBERBOND® flange. There is only one exception to this rule and that is when the alloy flange is a drilled-and-tapped blind flange supplied by the fabricator. In this case, the groove is applied to the alloy blind flange.

C. For connections to full-face flanged valves, lug type valves, or wafer valves that do not have an integral seal, a groove is applied to the FIBERBOND® flange.

D. For connections to valves with integral seals (not seats), as is typical with many butterfly valves, no groove is applied to the FIBERBOND® flange as no gasket is used.

E. For connections to raised face flanges, an o-ring groove is not needed. A full-face 1/8" (3mm) thick rubber gasket, such as red rubber "SBR" can be used. The takeout for the gasket is 1/8" (3mm).

F. O-ring grooves are not applied to FIBERBOND® flanges smaller than 2" (50mm) diameter. If the connection is not to an alloy blind flange that can be "grooved" by the fabricator, then a full-face 1/8" (3mm) thick rubber gasket can be used.

G. For flange to blind flange connections, normally the groove is placed in the blind flange. Blind flanges are usually slightly less expensive to "groove" than flanges.

---

## **FLANGES:**

1. All flanges are flat face and should be bolted to flat face flanges. FIBERBOND® flanges can be bolted to raised-face flanges, however, care should be taken when torquing these flanges. Over-torquing can cause cracking in the flange.
2. The flange thickness will differ from ANSI B16.5 150#.
3. The outside diameter and bolt pattern will match 150#. Other bolt patterns, such as 300# and BS4504 PN10 & PN16, can be provided. The flange will still be limited to its standard pressure and temperature rating.
4. Reducing flanges are also available.

## **NUTS, BOLTS, & WASHERS:**

1. There are no special requirements for bolting materials except that ANSI B18.22.1 Type A Narrow "SAE" series washers must be used. ANSI B18.22.1 Type A Wide "USS" washers will not fit on FRP flanges.

## **LATERAL WELDS AND FITTINGS:**

1. Lateral welds are currently only rated for design pressures up to 100psig (6.9bar) up to 16in. (400mm) diameter and 50psig (3.4bar) for larger sizes. If higher pressures are required, please consult with Specialty Plastics.

## **CERTIFICATIONS AND APPROVALS:**

Series 20HV	ABS 00 NO 32171-X
Series 20HV-C	Not currently listed
Series 20HV(FDA)	Not currently listed

## **ANSI DIMENSION FITTINGS:**

ANSI dimension flanged fittings are available upon request, but are rated only to 150psig (10.3bar). Please consult Specialty Plastics for information on these fittings.

## **VICTAULIC CONNECTIONS:**

For most pipes up to 12in. nominal diameter, ends can be machined to fit a victaulic coupling. Please consult Specialty Plastics for information on these fittings.

## **VPDMS, PDS, and AutoCAD CATALOGS:**

A catalog for Aveva Inc.'s 3D modeling software VPDMS is available by contacting Specialty Plastics ([www.fiberbond.com](http://www.fiberbond.com)). A 2-D catalog is also available for Autodesk's AutoCAD. A general catalog is also available for Intergraph's PDS.

## **SPECIAL NOTES ON DRAIN SYSTEMS:**

Slopes can be fabricated in FIBERBOND® systems at any angle. When shop prefabrication work is performed by Specialty Plastics, laterals can be fabricated at special angles, such as 45.9 degrees (for a 3/16" sloped header). This eliminates the need for any special dimensioning. The same is true for tees and reducing tees. In sloped systems, elbows are normally kept at their full sweep for 45 or 90 degrees and the pipe is mitered to maintain the slope in the header.

## WALL THICKNESSES & OUTSIDE DIAMETERS:

All FIBERBOND® Fiberglass Piping Series are manufactured with a fixed inside diameter. As the pressure rating of the pipe series increases, the wall thickness and outer diameter also increase.

### Ratings, Wall Thicknesses, and Outside Diameters

1. Sizes 2.5", 5", and 54" are non-standard and are not as readily available as the standard sizes.

---

## CHANGES FROM THE PREVIOUS EDITION

April 2016: Revised statement about  $\leq 2$ " gaskets at 435psig (30 bar) hydrotests in the Gaskets section to match the Gasket Selection document. No other changes made.

November 2014: Combined flanges and blinds into one section. Moved bleed rings, vanstone flanges and Fig.19MH/MC blinds to the Special Fittings Guide. Removed Fig.80F3.

January 2013: Added note on flange neck lengths. Added note on the pigmented exterior of fittings and flanges (in the Elbows section).

January 2012: Updated the drawing for the Fig.47JF MNPT olet. Also changed the layout of information; added note on gaskets.

September 2010: Increased "LS" dimension for 14" and larger Fig.46 branch sizes (e.g. 16"x14", 18"x14", 18"x16", ..., 24"x20") by 2" to 5".

April 2010: Updated available reducing tee sizes.

March 2010: Clarified that the Fig.46 and Fig.48 olets consist of the branch fitting only. Added reference to 20HV(FDA)-C.

February 2010: Corrected the LTHK2 and L2 lengths for the Fig.10-O orifice flanges.

July 2009: Removed Fig.95F and Fig.97.

April 2009: Changed wording on gasket recommendations.

August 2008: Changed wording on material choices for the Fig.47JF MNPT olet and Fig.94 threaded blind flange. Changed "metallic" to "alloy" throughout the document.

March 2008: Corrected FTHK and FOD on the Elbows page. No other changes were made.

January 2006: Corrected the LS dimension from 8" to 9" for the 6"x3", x2.5", x2", x1.5", and x1" FE olets and from 10" to 9" for the 5"x4" (only the detailed table was corrected).

June 2005: This is the first release of this stand-alone guide for 20HV, 20HV-C, and 20HV(FDA). Information was previously contained in our general Fittings Guide. Added weights and SI units to all the tables. Updated letter designations in the figures so that all are unique (e.g. changed "A" to "G" for Fig.40, Fig.43 tees and changed "A" to "H" for Fig.48 olets). Changed hemicap to cap. Added reducing tees. Changed the Fig.95F and 97 rating to 150psig in all sizes.

February 2005: Corrected lateral pressure ratings.

---

December 2004: Updated pressure rating, wall thickness, & flange thickness for 20HV and 20C in sizes 20" and 24". Added Fig.10o and Fig.15 data for sizes above 24". Added new note on gaskets. Added thicknesses and O.D.s for fittings. Added note for Fig.47JF MNPT olets.

August 2003: No dimensional changes were made. Additional information was added about the threaded connections, rules for o-rings, and selection of gaskets in the preceding pages.

April 2003: Details of the Figure 47 FNPT alloy saddle have been removed from the Fittings Guide. Details of the Figure 47JF MNPT alloy saddle have been added. The "C" dimension of the Figure 88 Reducing Lateral was corrected. The thickness of the Figure 17 Bleed Ring were changed to 1.5" for sizes up to 12". Changed dummy leg size for Figure 90 for elbow sizes 6", 14", 16", and 18".

May 2002: Quantity and size of bolts and capscrew data was added to the Bolt Lengths table. Added a "Blinds & Bleed Rings" section with Figures 16, 17, 19H, and 19C. Information on "pup" lengths was added to the Dummy Legs & Hemicaps section. Information on the availability of reducing flanges was added to the Flanges section.

March 2002: The "C" and "C+L" dimensions for the 3" and 6" Figure 30 elbows were corrected. The "C" dimension was changed from 1 5/8" to 1 7/8" for 3" diameter and 3 3/8" to 3 3/4" for 6" diameter. Other minor text changes were made throughout the document.

January 2002: In the January 2002 document, only minor changes have been made. The lettering terminology for the Figure 20, 20PF, and 20FF elbows were corrected so that the table matched the figure. No values changed. The pipe outside diameter of various series was listed incorrectly for the 18" size only. The outside diameters that were 18.38" should have been listed as 19.38".

April 2001 Rev 2: In Rev 2, the "B" dimension in the table for Figures 46 and 48 was changed to "LS" to match the figure. The "E" and "E+L" dimensions for a 6" x 2" reducer (Fig.60 & 61) were changed to 10" and 16", respectively. The previous dimensions were incorrect.

April 2001: A great deal of new information is included in this edition of the Fittings Guide. The only change from our previous edition is the 'L' dimension of our Fig.10 Flange in sizes 20" and larger. These dimensions have increased by 3" for sizes 20", 24", and 30", 9" for sizes 36" and 42", and 6" for sizes 48" and 60". The Max.L dimension has also increased by 6" for sizes 36", 42", and 48". These changes have also affected the dimensions of Fig.20PF, 20FF, 30PF, 30FF, 60PF, 60FF, 61PF, and 61FF.

# FLANGES & BLINDS (cont'd)

1. Flanges that are shipped loose for site installation are normally manufactured with a neck length up to 3" longer than the "L" and "L2" values specified in this table.
2. For Fig.15, the minimum L length for the Fig.15 flange requires special fabrication techniques and normally requires additional time for delivery.

1. The F/F column is for FRP to FRP flange connections. The F/S column is for FRP to 150# alloy flange connections.

2. For FRP to FRP flange connections,  $LSSB = 2 * (\text{Flange Thickness} + \text{PTOL} + \text{Nut Thickness}) + 1/8" + (2 * 1/8")$ .

3. For FRP to 150# alloy flange connections,  $LSSB = \text{Flange Thickness} + \text{PTOL} + 150\# \text{ Flange Thickness} + \text{PTOL} + (2 * \text{Nut Thickness}) + 1/8" + (2 * 1/8")$ .

4. PTOL = 1/8" up to 18" nominal size and 3/16" above 18" nominal size. 1/8" accounts for the gasket. (2 \* 1/8") accounts for two washers.

42"	50	3.4				
48"	50	3.4				
54"	50	3.4				
60"	50	3.4				

1. These ratings are also valid for flanges (Fig.10, Fig.10O, Fig.11, & Fig.15), blind flanges (Fig.16, Fig.19MC, Fig.19MH), bleed rings (Fig.17), tees (Fig.40, Fig.40PPF, & Fig.40F3), saddles (Fig.46 & Fig.48), reducers (Fig.60 & Fig.61), caps (Fig.96), MNPT saddles (Fig.47JF), and "dummy legs" (Fig.90 & Fig.91). Laterals (Fig.80 & Fig.80F3) and reducing laterals (Fig.88) are only rated to 100psig up to 16" and 50psig up to 60". The FRP FNPTs (Fig.97 and 95F) are only rated to 150psig up to the 2" NPT size.

2. Fittings and flanges that are shipped loose for site installation are typically shipped without any pigmented gelcoat. This is due to the fact that the gelcoat would have to be removed during the bonding process.

# REDUCERS (cont'd)

1. Offset dimension for eccentric reducers is 0.5" x (FOD - FROD).
2. Reducers may be available in other sizes than those shown above. Min. E+L dimensions are also available.
3. The FLOD and FLOD2 dimensions match ASME B16.5 150# and B16.1 125# O.D.s.

54"	60"	36"	36"	36"	38"	38"	40"	40"	44"											

1. The 'H' dimension is based on header size. The 'A2' dimension is based on branch size. The 'LS' dimension is based on both header and branch size; e.g. 3" on 6" Fig. 46 has LS = 9", A2 = 7"
2. An outlet fitting includes only the branch components. Unless purchased as part of a pre-fabricated (pre-assembled) system, it does require some assembly and bonding work.

# REDUCING LATERAL OLETS (cont'd)

1. The 'J' dimension is based on header size. The 'K' dimension is based on branch size. The 'J2' dimension is based on header and branch size; e.g. 3" on 6" Fig. 88 has J=16", K=12", J2=12".
2. Standard reducing laterals are limited to a 100psig design pressure up to 16" and 50psig up to 60".

# DUMMY LEGS, CAPS, PUP PIECES (cont'd)

1. Fig. 90 and Fig. 91 include the dummy leg only, not the elbow nor pipe. Dummy legs can also be placed under tees and reducers.
2. Maximum dummy leg length is 3'-0". Specify the required leg length with the figure number.
3. Plate to be shipped loose and field installed. 6" of trim to be provided on dummy leg.
4. In shop prefabricated systems, the Fig.1 'Y' dimension can be as short as 1".

# THREADED CONNECTIONS

For Series 20HV, 20HV-D, 20HV(FDA) and 20HV(FDA)-C, the threaded options are: 1) the Figure 94 Flanged Saddle with drilled-and-tapped alloy blind flange and 2) the Figure 47JF threaded alloy MNPT. The Figure 97 threaded FRP FNPT is no longer a standard product.

1. Fig.94: The most reliable and heavy-duty solution for threaded connections is to use an FRP flange and bolt an alloy (316SS, 90/10 Cu-Ni, Gr. 2 Ti, etc.) blind flange that is drilled-and-tapped for the NPT size. This type of connection has been used for many years and is the most durable and toughest solution.
2. Fig.47JF: To eliminate the need for a bolted connection, the Figure 47JF MNPT alloy saddle is available. Alloy material choices include 316SS, 90/10 Cu-Ni, Titanium, and Monel. Other alloy materials may be available. This alloy MNPT is designed for connections to spray nozzles in deluge systems and can also be used for connecting to vents, drains, and instruments. Due to the large bending moment that could be applied, it is not recommended that the Fig.47JF MNPT be used to connect directly to long runs of threaded alloy piping. Note: the alloy MNPT is permanently bonded to the FRP piping.

## Notes:

1. The Fig.47JF sizes are 0.50", 0.75", 1.0", 1.25", and 1.5" MNPT. The 'H2' dimension is approximate and will vary based on the pipe wall thickness. Material choices include 316SS, 90/10 Cu-Ni, Titanium, Monel, and others.
2. The Fig.47JF outlet fitting includes only the branch components. Unless purchased as part of a pre-fabricated (pre-assembled) system, it does require some assembly and bonding work.
3. The Fig.94 threaded alloy blind includes the drilled-and-tapped alloy blind flange only. The branch size is 2" diameter, standard. Other branch sizes are available upon request. Material choices for the alloy blind flange include 316SS, 90/10 Cu-Ni and others.
4. For Fig.47JF, CMODs are: 0.56" (14.3mm) for 1/2", 0.81" (20.6mm) for 3/4", 1.06" (27.0mm) for 1", 1.31" (33.3mm) for 1 1/4", and 1.56" (39.7mm) for 1 1/2" MNPTs.
